Why SEO Matters for Next.js Websites

Next.js is great for building fast websites, but **without proper SEO**, your content might never reach your audience. Search engines like Google need clear signals to understand and rank your pages. Let's fix that!

Step 1: Start with the Right Next.js Setup

a. Choose the App Router (Not Pages Router)

Next.js 13+ introduced the App Router, which simplifies SEO with built-in tools.

Create your project with:

```
npx create-next-app@latest
```

b. Folder Structure

Organize your files like this:

```
/app
  /blog
    /[slug] # Individual blog posts
      page.tsx
    layout.tsx
    page.tsx
  /public
    /images
```

Why this matters: Clean structure = easier for search engines to crawl.

Step 2: Optimize Metadata (Your Page's ID Card)

Metadata tells search engines what your page is about.

a. Global Settings (app/layout.tsx)

Add default metadata for all pages:

```
export const metadata = {
  title: "Your Website Name | Catchy Tagline",
  description: "A website about [your niche] for [your audience].",
  keywords: ["main keyword", "secondary keyword", "topic"],
  openGraph: {
```

```
    images: '/default-og-image.jpg' # For social sharing
  }
}
```

b. Page-Specific Metadata (app/blog/[slug]/page.tsx)

Customize for individual pages:

```
export async function generateMetadata({ params }) {
  const post = await fetchPost(params.slug); // Get post data
  return {
    title: `${post.title} | Your Website Name`,
    description: post.shortSummary,
    openGraph: {
      images: post.coverImage,
    },
  };
}
```

Pro Tip: Use keywords naturally in titles/descriptions. No stuffing!

Step 3: Create SEO-Friendly URLs

Bad URL: /post?id=123

Good URL: /blog/how-to-optimize-nextjs-seo

How to do it:

1. Use descriptive words in URLs
2. Separate words with hyphens (-)
3. Keep it short (under 5 words)

Step 4: Speed Up Your Website

Google loves fast websites. Here's how to optimize:

a. Use Next.js Image Component

Replace `<img>` with:

```
import Image from 'next/image';

<Image
  src="/your-image.jpg"
  alt="A descriptive text"
  width={800}
  height={400}
  priority # For important images
/>
```

b. Compress Images

Use free tools like [Squoosh](#) before uploading.

c. Lazy Load Off-Screen Images

```
<Image src="..." loading="lazy" />
```

d. Self-Host Fonts

Use `next/font` to avoid render-blocking:

```
import { Inter } from 'next/font/google';
const inter = Inter({ subsets: ['latin'] });
```

Step 5: Structure Your Content Properly

a. Use HTML Headers Correctly

- Only ONE H1 per page (your main title)
- Use H2 for sections, H3 for subsections

Example:

```
<h1>Best SEO Practices for Next.js</h1>
<h2>Why Metadata Matters</h2>
<h3>How to Write Good Descriptions</h3>
```

b. Add Schema Markup

Help Google understand your content with structured data. Add this to your blog post pages:

```
<script type="application/ld+json">
  {JSON.stringify({
    "@context": "https://schema.org",
    "@type": "BlogPosting",
    "headline": "Your Post Title",
    "datePublished": "2024-01-01",
    "author": { "@type": "Person", "name": "You" }
  })}
</script>
```

Step 6: Pre-Render Pages for Instant Loading

Static Site Generation (SSG) is better for SEO than client-side rendering.

a. Generate Pages at Build Time

```
// app/blog/[slug]/page.tsx
export async function generateStaticParams() {
  const posts = await fetchPosts();
  return posts.map((post) => ({ slug: post.slug }));
}
```

b. Update Content Periodically

Use Incremental Static Regeneration (ISR):

```
export const revalidate = 3600;
```

Step 7: Internal Linking Strategy

Link to your own content to:

- Help users discover more
- Show Google your site's structure

Example:

<p>Learn more about <Link href="/blog/nextjs-performance-tips">Next.js performance</Link>.</p>

Step 8: Create a Sitemap

A sitemap helps Google find all your pages.

a. Install next-sitemap:

```
npm install next-sitemap
```

b. Add next-sitemap.config.js:

```
module.exports = {  
  siteUrl: 'https://yourdomain.com',  
  generateRobotsTxt: true,  
};
```

c. Add Script to package.json:

```
"scripts": {  
  "postbuild": "next-sitemap"  
}
```

Step 9: Test & Monitor

a. Check Page Speed:

- Run `npm run build && npm run start`
- Test with [Google PageSpeed Insights](#)

b. Validate SEO:

- Use [Google Search Console](#)
- Test with [Ahrefs SEO Toolbar](#)

Final SEO Checklist

1. ☒ All pages have unique titles/descriptions
2. ☒ Images have alt text & are compressed
3. ☒ URLs are clean and descriptive

4.  Schema markup added to key pages
5.  Sitemap submitted to Google Search Console

Common Mistakes to Avoid

- **Duplicate Content:** Use canonical tags if you repost content.
- **Ignoring Mobile Users:** Test responsiveness with Chrome DevTools.
- **Forgetting Alt Text:** Every image needs a description.

By following these steps, your Next.js website will rank higher in search results, bringing more organic traffic. Remember: **SEO is a marathon, not a sprint**. Keep updating content and monitoring analytics!

ABSTRACT

Post-training alignment often reduces LLM diversity, leading to a phenomenon known as *mode collapse*. Unlike prior work that attributes this effect to algorithmic limitations, we identify a fundamental, pervasive data-level driver: *typicality bias* in preference data, whereby annotators systematically favor familiar text as a result of well-established findings in cognitive psychology. We formalize this bias theoretically, verify it on preference datasets empirically, and show that it plays a central role in mode collapse. Motivated by this analysis, we introduce *Verbalized Sampling (VS)*, a simple, training-free prompting strategy to circumvent mode collapse. VS prompts the model to verbalize a probability distribution over a set of responses (e.g., “Generate 5 jokes about coffee and their corresponding probabilities”). Comprehensive experiments show that VS significantly improves performance across creative writing (poems, stories, jokes), dialogue simulation, open-ended QA, and synthetic data generation, without sacrificing factual accuracy and safety. For instance, in creative writing, VS increases diversity by $1.6\text{--}2.1\times$ over direct prompting. We further observe an emergent trend that more capable models benefit more from VS. In sum, our work provides a new data-centric perspective on mode collapse and a practical inference-time remedy that helps unlock pre-trained generative diversity.

Problem: Typicality Bias Causes Mode Collapse

Tell me a joke about coffee

Solution: Verbalized Sampling (VS) Mitigates Mode Collapse

Different prompts collapse to different modes:
